These sub-satellite bows tie together all three orbits (Fig. 3). The third stage separates from the second stage in the domain around angle $\phi = 90^\circ$, which is the point where the velocity vector is horizontal. At this point, the velocity vector is horizontal, and the third stage has a velocity of $v_3 = v_{\perp} = v_{\parallel}$. The third stage then follows the same path as the second stage, but with a smaller radius.
